Profile

I study Automation Engineering in a work-study program and build systems with AI and robotics. I'm most interested in reinforcement learning, physical AI and systems that interact with the real world. Right now I'm building a Sesame Robot and training it with reinforcement learning. I use coding agents like Claude Code and Codex for implementation and focus on system design, debugging and validation.

Education

Automation Engineering, work-study program — 10/2024 to 12/2027 (expected)
Hochschule Bremen (academic phases) and KUKA (practical phases)

Abitur (German university entrance qualification) — 2024
Gymnasium Vegesack, Bremen

Hackathons

Mobile Robotics Hackathon, CeTI, TU Dresden · 1st place — 10/2026
We sorted waste with a robot arm, using 6D pose estimation and machine learning.

Hack-Nation 7 · Where Helpy started — 10/2026

Smart Region Hackathon Offenburg · Where Baulify started — 05/2026

Projects

Nozzle offset calibration for FDM 3D printing (KUKA) — 2026
My longest project so far. Errors of a few tenths of a millimeter already showed in the parts, and the offset shifted with temperature and after nozzle changes. I found a reliable, repeatable way to measure it, separated real offset errors from causes like bed leveling or material behavior, and turned it into a process the team can rerun without me. Getting consistent results took many rounds of test prints and measurements.

Developer Island: a status capsule for the Windows desktop — 10/2026
A native app at the top of the screen for Claude Code and Codex usage, music, focus timer, meetings and system health. Reads local logs incrementally, no polling, no cloud. Idles at 55 MB and 0.03 % of one CPU core, 382 unit tests, open source.

Sesame Robot: reinforcement learning on real hardware — in progress
I'm building a Sesame Robot and training it with reinforcement learning. After the double pendulum in simulation, this is the step to a real robot.
Reinforcement learning · Robotics

Reinforcement learning: one policy, four poses of a double pendulum — 09/2026
A single TQC policy I trained swings a double pendulum on a cart into each of its four poses and switches between them on demand. 100 % success across all 4×4 transitions after 1.7M steps, trained on a laptop CPU. It runs live in the browser on my website.
Python · Gymnasium · MuJoCo · Stable-Baselines3 · sb3-contrib (TQC) · TypeScript

Helpy: capturing an expert's judgment while they work (team) — 10/2026
Started at Hack-Nation 7. An assistant that watches an expert work, listens and asks about decisions at natural pauses. The result is a Work Map of steps, rules and reasons that a new colleague practices with. Screenshots are OCR'd and redacted in the browser (378 ms on a simple screen).

Skills

Reinforcement learning & simulation	Gymnasium, Stable-Baselines3 (PPO, SAC, TQC), MuJoCo
Local AI & speech	faster-whisper, Piper TTS, Ollama, ONNX / DirectML, LLMs via OpenRouter
Software & web	Python, TypeScript, JavaScript, C#, .NET, WinUI 3, Next.js, Astro, PostgreSQL, Drizzle, MapLibre
Automation & tooling	n8n, Claude Code, Codex, Git
Languages	German (native), English (C1)

As of October 2026
